Meeting Notes

Since the deadline is fast approaching, we obviously need to prioritize which tasks we think are most important to get done. We can make a spreadsheet while we work and check things off as we finish them.

We definitely need unit tests!!

Yang asked what we should do in the situation where a user types in random garbage into the URL field. We decide it would be best to reroute random URLS that the user just decides to type in back, to root. Same goes if the user tries to access a cabal they are not authorized to.

For the window-resizing problem, maybe we can use the bootstrap grid to lay out chat window instead so that the members and the chat modules won't overlap on a smaller window size.

For the presentation, we should not show trivial things like the process of creating an account. Additionally, the person speaking should probably not be the same person operating the app on the laptop.

We don't need to worry about encrypting chat messages. It's not an obviously-visible feature and there exists an easy solution -- paying -- which we don't want to do.
